No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                  Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /cgn2_6/ptodata/1/iaa/5A_COMB.pep:*

Sequence 3225, Application US/09134001C
Patent No. 6380370
GENERAL INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCC
TITLE OF INVENTION: EPIDERMIDIS FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: GTC-007
CURRENT PILICIG DATE: 1998-08-13
PRIOR APPLICATION NUMBER: US 60/064,964
PROR FILING DATE: 1997-11-08
PRIOR APPLICATION NUMBER: US 60/055,779
PRIOR APPLICATION NUMBER: US 60/055,779
PRIOR FILING DATE: 1997-08-14
NUMBER OF SEQ ID NOS: 5674
SEQ ID NO 3225

Patent No. US20020137671A1

GENERAL INFORMATION:

APPLICANT: University of British Columbia

TITLE OF INVENTION:

TITLE OF INVENTION: Production and use of Modified Cystatins

FILE REFERENCE: 58069

CURRENT APPLICATION NUMBER: US/09/775,932

CURRENT FILING DATE: 1099-08-05

PRIOR FILING DATE: 1999-08-05

PRIOR APPLICATION NUMBER: 60/095,503

PRIOR FILING DATE: 1999-08-05

NUMBER OF SEQ ID NOS: 32

SOFTWARRE: Patentin Ver: 2.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Submitted (AUG-1995) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: HAS BOTH AN APURINIC AND/OR APYRIMIDINIC ENDONUCLEASE
ACTIVITY AND A DNA N-GIXCOSYLASE ACTIVITY (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: The C-O-P bond 3' to the apurinic or apyrimidinic site in DNA is broken by a beta-elimination reaction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    leaving all terminal unsaturated sugar and a product with a terminal 5'-phosphate.
-!- COFACTOR: BINDS A 4FE-4S CLUSTER WHICH IS NOT IMPORTANT FOR THE CATALYTIC ACTIVITY, BUT WHICH IS PROBABLY INVOLVED IN THE PROPER POSITIONING OF THE BRAYME ALONG THE DNA STRAND (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE NTH/MUTY FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Caenorhabditis elegans.

-I PROKITON: DNA REPARK EMZYME THAT INCISES DNA AT 8-OXG RESIDUES. EXCISES 7.8-DIMYDRO-8-OXGUANINE AND 2.6-DIAMINO-4-HYDROXY-5-N-METHYLPORMAMIDOPRIMIDINE (FRPY) FROM DAMAGED DNA. HAS A BETALYREORMAMIDOPRIMIDINE (FRPY) FROM DAMAGED DNA. HAS A BETALYREORMAMIDOPRIMIDINE (FRPY) FROM DAMAGED UNA. HAS A BETALYREORMAMIDOPRIMIDINE (FRPY) FROM DAMAGED ONA. HAS A BETALYREORMAMIDOPRIMIDINE (FRPY) FROM Cleavage near apurinic or apyrimidinic sites to products with 5'-phosphate.

"Rat 7,8-dihydro-8-oxoguanine DNA 91ycosylase: substrate specificity,
kinetics and cleavagemechanism at an apurinic site.";
Nucleic Acids Res. 26:5199-5202(1998).
-!- FUNCTION: DNA REPAIR ENZYME THAT INCISES DNA AT 8-OXOG RESIDUES.
EXCISES 7.8-DIHYDRO-8-OXOGUANINE AND 2,6-DIAMINO-4-HYDROXY-5-N-
METHYLEORMAMIOPYRIMIDINE (FAPY) FROM DAMAGED DNA. HAS A BETA-
LYASE ACTIVITY THAT NICKS DNA 3' TO THE LESION.
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage near apurinic or
apyrimidinic sites to products with 5'-phosphate.
-!- SUBCELLULAR LOCATION: Nuclear (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rattus norvegicus (Rat).

CATALYTIC ACTIVITY: The C-O-P bond 3' to the apurinic or apprinding tion reaction, apprinding site in DNA is broken by a beta-elimination reaction, leaving a 3'-terminal unsaturated sugar and a product with a terminal 5'-phosphate.

COPACTOR: BINDS A 4FE-4S CLUSTER WHICH IS NOT IMPORTANT FOR THE CATALYTIC ACTIVITY, BUT WHICH IS PROBABLY INVOLVED IN THE PROPER POSITIONING OF THE ENZYBE ALONG THE DAMA STRAND (BY SIMILARITY).

-!- CATALYTIC ACTIVITY: The C-O-P bond 3' to the apurinic or apyrimidinic site in DNA is broken by a beta-elimination reaction, leaving a 3'-terminal unsaturated sugar and a product with a terminal 5'-phosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA repair;

ACTIVITY AND A DNA N-GIYCOSYLASE ACTIVITY. INCISES DAMAGED DNA AT
CYTOSINES, THYMINES AND GUANINES. ACTS ON A DAMAGED STRAND, 5'
FROM THE DAMAGED SITE (BY SIMILARITY).

--- CATALYTIC ACTIVITY: The C-O-P bond 3' to the apurinic or
apyrimidinic site in DNA is broken by a beta-elimination reaction,
leaving a 3'-terminal unsaturated sugar and a product with a
terminal 5'-phosphate.

--- COFACTOR: BINDS A 4FE-4S CLUSTER WHICH IS NOT IMPORTANT FOR THE
CATALYTIC ACTIVITY, BUT WHICH IS PROBABLY INVOLVED IN THE PROPER
POSITIONING OF THE ENTYME ALONG THE DNA STRAND (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PROSITE; PS00764; ENDONUCLEASE_III_1; 1.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to human nucleic acids (AAI57798-AAI61369) and
the encoded polypeptides (AAM38642-AAM42213) with nootropic,
the encoded polypeptides (AAM38642-AAM42213) with nootropic,
limunosuppressant and cytostatic activity. The polynuclectides are useful
in gene therapy. A composition containing a polypeptide or polynucleotide
c of the invention may be used to treat diseases of the peripheral nervous
system, such as peripheral nervous injuries, peripheral nervous
c system, such as not central nervous system diseases, anch as
localised neuropathies and central nervous system diseases, anch as
Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic
lateral sclerosis, and Shy-Drager Syndrome. Other uses include the
tulisation of the activities such as: Immune system suppression,
Activin/inhibin activity, chemotactic/chemothetic activity, haemostatic
and thrombolytic activity, cancer diagnosis and therapy, drug screening,
ssays for receptor activity, arthritis and inflammation, leukaemias and
c.N.S disorders.
Note: The sequence data for this patent did not form part of the printed
specification.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, inmunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the Activity the activities such as Immune system 'superssion' Activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Wang D;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                          Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a cares. The disorders include SAPHO syndrome (synovitis, acne, P. acnes; The disorders include SAPHO syndrome (synovitis, acne, P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgatis. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as the diagnostic agents for determining P. acnes presence, for example, by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          enzyme linked immunosorbent assay (ELLSA).
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a polypeptide that is critical for the survival and growth of Candida albicans. The C. albicans nucleic acid molecules encoding the polypeptides of the invention may be used as probes and

primers for detecting homologous nucleic acid molecule sequences. The polypeptides and nucleic acid molecules and compounds identified as selectively modulating the expression of the polypeptides, may be used as medicaments or for the preparation of a medicament to treat C.albicans associated diseases, especially in AIDS patients and to treat vulvovaginitis in otherwise healthy females. The use of the polypeptides and polynucleotide sequences to treat C.albicans associated diseases has fewer side effects and less toxicity than previously used methods such as the use of amphotericin. This method is therefore especially suitable for immunocompromised patients, such as AIDS patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wang D;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Db
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                             The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA019300) that exhibit activity elating to cytokine. cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activity in activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                 treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Buchrleser C, Frangeul L, Couve E, Rusniok C, Faihi H, Dehoux P, Dussurget O, Chetouani F, Nedjari H, Glaser P, Kunst F, Cossart P, Daniels J, Goebel W, Kreft J, Kuhn M, Ng E, Vazquez-Boland JA; Dominguez-Bernal G, Garrido-Garcia P, Tierrez-Martinez A, Amend A, Chakraborty T, Domann E, Hain T, Berche P, Charbit A, Durant L; Perez-Diaz J, Baquero F, Garcia Del Portillo F, Gomez-Lopez N; Maduenio E, De Pablos B, Wehland J, Kaerst U, Entian K, Hauf J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related bacterial infections, and

The present invention relates to the genome sequence of Listeria

monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.

monocytogenes and related organisms, and for studying genetic
color polymorphisms and other genomes. The present sequence is a protein
cerocade by the genome sequence of the present invention. Proteins
expressed from the genome sequence are useful for raising specific
antibodies, identification of L. monocytogenes and related organisms, and
for lossynthesis and blodegradation, especially blossynthesis of Vitamin
B12. The genome sequence and proteins encoded by it are also useful for
selecting compounds that regulate gene expression and cell replication
and modulate L. monocytogenes related diseases. In addition, the genome
sequence and proteins encoded by it are useful in pharmaceutical and
vaccines compositions for the treatment or prevention of infections by L.
monocytogenes and related organisms.
CC Note: The sequence data for this patent did not form the printed
specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                               the treatment, proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO Syndrome (synovitis, acne, practices and osteomycelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lessions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a ample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes properly by P. acnes protein in the sample, by acnes infections. The antibodies may also be used as clargment inked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed a per interval in the sample, by the feature of the printed and th

sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence 1s selected from those defined in the specification: The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13678 and AAH18633 to AAH18672 represent human cDNA sequences; AAB9446 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; cytokine; cell proliferation; cell differentiation; gene therapy; vacchie; peptide therapy; stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                     The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

complement encoding a polypeptide having a sequence at least 40%

identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B

or Cor their combinations. Also included are an expression

cassette comprising the polynuclectide or comprising a heterologous

DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated

comparison of DMT, a host cell comprising an exogenous polynucleotide

concing a DMT-like protein. The expression cassette is

concing a DMT-like protein. The expression cassette is

concing a DMT-like protein. The expression cassette is

concing a DMT-like protein. The method comprises introducing

the cassette into a host cell preferably Agrobacterium by sexual

consolidation is capable of exhibiting at least one of the following

concing a protein is capable of exhibiting at least one of the following

biological activities, which include enhanced expression of the

protein in a plant results in a delay in flowering time, introduction of

chromosomal DNA in the cell, reduction of expression of the protein in a

plant results in enhanced endosperm development and expression of the

chromosomal DNA in the cell, reduction of expression of the protein in a

plant results in enhanced endosperm development and expressing of the

chromosomal DNA in the cell, reduction of expression of the Protein in a plant results in expression of the protein in a contract of the protein in a sample.

Concording the contract of the protein and expression of the protein of the protein in a plant results of the protein in a plant present for detecting a nucleic acid in a sample.

Concording the contract of the present 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .;

                                                                                                                                                                                                    bolynucleotide encoding a by Tilke protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of the protein in an Arabidopsis leaf results in expression of the MEDEA gene protein in an Arabidopsis leaf results in expression of the MEDEA gene protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylation. The present transcription of target genes by demethylation. The present
                              The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETRE, previously known as ATROPOS (ATR)) Domain A, Bo or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence, DMT 3' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a encoding a DMT-like protein and a transgenic plant comprising a polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of their protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the cell, reduction of expression of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide to S-methylstytosine glycosylases and regulates transcription of target genes by demethylation. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    comprising a sequence or C -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DWT (DEMETER, previously known as ATROPOS (ATR)) Domain A, or C or their combinations.                                                                                   polynucleotide encoding a by Talke protein. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of chromosomal DNA in the call, reduction of expression of the protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylation, The present transcription of target genes by demethylation. The present
cassette comprising the polynucleotide or comprising a heterologous polynucleotide under the control of a promoter at least 70% identical to DMT 5' flanking sequence or an 5' untranslated region of DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein and a transgenic plant comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
